Recommendation Table 1, Recommendations for the				
provision of service of multidisciplinary cardiomyopathy				
teams, side 17	Class	Level		
It is recommended that all patients with				
cardiomyopathy and their relatives have access to				
multidisciplinary teams with expertise in the				
diagnosis and management of cardiomyopathies.	1	С	Ja	
Timely and adequate preparation for transition of				
care from paediatric to adult services, including joint				
consultations, is recommended in all adolescents				
with cardiomyopathy.	I	С	Ja	
Recommendation Table 2, Recommendations for				
diagnostic work-up in cardiomyopathies, side 18	Class	Level		
It is recommended that all patients with suspected or				
established cardiomyopathy undergo systematic				
evaluation using a multiparametric approach that				

Bør tilpasses den enkelte patient.

underlying aetiology, determine inheritance pattern, and identify at-risk relatives.	I	С	Ja	
Recommendation Table 3 Recommendations for				
laboratory tests in the diagnosis of cardiomyopathies, side 22	Class	Level		
Routine (first-level) laboratory testsc are				
recommended in all patients with suspected or				
confirmed cardiomyopathy to evaluate aetiology,				
assess disease severity, and aid in detection of				
extracardiac manifestations and assessment of				
secondary organ dysfunction.	I	С	Bør tilpasses den enkelte patient.	
Additional (second-level) testsc should be considered				
in patients with cardiomyopathy and extracardiac				
features to aid in detection of metabolic and				
syndromic causes, following specialist evaluation.	lla	С	Ja	

С

includes clinical evaluation, pedigree analysis, ECG, Holter monitoring, laboratory tests, and

It is recommended that all patients with suspected cardiomyopathy undergo evaluation of family history and that a three- to four-generation family tree is created to aid in diagnosis, provide clues to

multimodality imaging

Recommendation Table 4 Recommendation for				
echocardiographic evaluation in patients with				
cardiomyopathy, side 22	Class	Level		
A comprehensive evaluation of cardiac dimensions				
and LV and RV systolic (global and regional) and LV				
diastolic function is recommended in all patients with				
cardiomyopathy at initial evaluation, and during				
follow-up, to monitor disease progression and aid				
risk stratification and management	L. L.	В	Ja	

Recommendation Table 5 Recommendations for			
cardiac magnetic resonance indication in patients with			
cardiomyopathy, side 24	Class	Level	
Contrast-enhanced CMR is recommended in			
patients with cardiomyopathy at initial			
evaluation	1	С	Bør tilpasses den enkelte patient.
Contrast-enhanced CMR should be considered in			
patients with cardiomyopathy during follow-up to			
monitor disease progression and aid risk stratification			
and management	lla	С	Gentagen MR scanning anbefales ikke rutinemæssigt, men kan overvejes i særlig
Contrast-enhanced CMR should be considered for			
the serial follow-up and assessment of therapeutic			
response in patients with cardiac amyloidosis,			
Anderson–Fabry disease, sarcoidosis, inflammatory			
cardiomyopathies, and haemochromatosis with			
cardiac involvement	lla	В	Bør tilpasses den enkelte patient.
In families with cardiomyopathy in which a			
disease-causing variant has been identified,			
contrast-enhanced CMR should be considered in			
genotype-positive/phenotype-negative family			
members to aid diagnosis and detect early			
disease	lla	С	Bør tilpasses den enkelte patient.
In cases of familial cardiomyopathy without a geneticdiagnosis, contrast-enhanced CMR	may beconsidered lib phene	oty © e-negative

computed tomography and nuclear imaging side 26	Class	Level	
DPD/PYP/HMDP bone-tracer scintigraphy is			
recommended in patients with suspected			
ATTR-related cardiac amyloidosis to aid			
diagnosis	1	В	Ja
Contrast-enhanced cardiac CT should be considered			
in patients with suspected cardiomyopathy who have			
inadequate echocardiographic imaging and			
contraindications to CMR	lla	С	Ja
In patients with suspected cardiomyopathy,			
CT-based imaging should be considered to exclude			
congenital or acquired coronary artery disease as a			
cause of the observed myocardial abnormality	lla	C	Bør tilpasses den enkelte patient.
18F-FDG-PET scanning should be considered for the			
diagnostic work-up in patients with cardiomyopathy			
in whom cardiac sarcoidosis is suspected	lla	С	Ja

Recommendation Table 7 — Recommendation for				
endomyocardial biopsy in patients with cardiomyopathy, side 26	Class	Level		
In patients with suspected cardiomyopathy, EMB				
should be considered to aid in diagnosis and				
management when the results of other clinical				
investigations suggest myocardial inflammation,				
infiltration, or storage that cannot be identified by				
other means	lla	С	Ja	

Recommendation Table 8 — Recommendations for genetic counselling and testing in cardiomyopathies Class Level

Genetic counselling, provided by an appropriately				
trained healthcare professional and including genetic				
education to inform decision-making and				
psychosocial support, is recommended for families				
with an inherited or suspected inherited				
cardiomyopathy, regardless of whether genetic				
testing is being considered.	1	В	Ja	
It is recommended that genetic testing for		-		
cardiomyopathy is performed with access to a				
multidisciplinary team, including those with expertise				
in genetic testing methodology, sequence variant				
interpretation, and clinical application of genetic				
testing, typically in a specialized cardiomyopathy				
service or in a network model with access to				
equivalent expertise.	1	В	Ja	
Pre- and post-test genetic counselling is				
recommended in all individuals undergoing genetic				
testing for cardiomyopathy.	1	В	Ja	
If pre-natal diagnostic testing is to be pursued by the				
family, it is recommended that this is performed early				
in pregnancy, to allow decisions regarding				
continuation or co-ordination of pregnancy to be				
made.	1	С	Ja	
A discussion about reproductive genetic testing				
ontions with an appropriately trained healthcare

It is recommended that cascade genetic testing, with pre- and post-test counselling, is offered to adult at-risk relatives if a confident genetic diagnosis (i.e. a P/LP variant) has been established in an individual with cardiomyopathy in the family (starting with first-degree relatives if available, and cascading out sequentially)

Cascade genetic testing with pre- and post-test counselling should be considered in paediatric at-risk relatives if a confident genetic diagnosis (i.e. a P/LP variant) has been established in an individual with cardiomyopathy in the family (starting with first-degree relatives, if available, and cascading out sequentially), considering the underlying cardiomyopathy, expected age of onset, presentation in the family, and clinical/legal consequences.

Testing for the presence of a familial variant of unknown significance, typically in parents and/or affected relatives, to determine if the variant segregates with the cardiomyopathy phenotype should be considered if this might allow the variant to be interpreted with confidence. Diagnostic genetic testing is not recommended in a phenotype-negative relative of a patient with cardiomyopathy in the absence of a confident genetic diagnosis (i.e. a P/LP variant) in the family.

Recommendation Table 9 — Recommendations for				
cardiac transplantation in patients with cardiomyopathy side 38	Class	Level		
Orthotopic cardiac transplantation is recommended				
for eligible cardiomyopathy patients with advanced				
heart failure (NYHA class III–IV) or intractable				
ventricular arrhythmia refractory to medical/invasive/				
device therapy, and who do not have absolute				
contraindications	I.	С	Ja	
				—

Recommendation Table 10 — Recommendation for				
left ventricular assist device therapy in patients with				
cardiomyopathy, side 38	Class	Level		
Mechanical circulatory support therapy should be				
considered in selected cardiomyopathy patients with				
advanced heart failure (NYHA class III–IV) despite				
optimal pharmacological and device treatment, who				
are otherwise suitable for heart transplantation, to				
improve symptoms and reduce the risk of heart failure				
hospitalization from worsening heart failure and				
premature death while awaiting a transplant.	lla	В	Ja	

Mechanical circulatory support therapy should be considered in selected cardiomyopathy patients with advanced heart failure (NYHA class III–IV) despite optimal pharmacological and device therapy, who are not eligible for cardiac transplantation or other surgical options, and without severe right ventricular dysfunction, to reduce the risk of death and improve symptoms.

Recommendation Table 11 — Recommendations for management of atrial fibrillation and atrial flutter in			
patients with cardiomyopathy side 41	Class	Level	
ANTICOAGULATION	Class	Levei	
Oral anticoagulation in order to reduce the risk of			
stroke and thrombo-embolic events is recommended			
in all patients with HCM or cardiac amyloidosis and AF			
or atrial flutter (unless		В	
contraindicated). Oral anticoagulation to reduce the risk of stroke and	I	в	19
thrombo-embolic events is recommended in patients			
with DCM, NDLVC, or ARVC, and AF or atrial			
flutter with a CHA2DS2-VASc score ≥2 in men or		В	
≥3 in women	I	В	19
Oral anticoagulation to reduce the risk of stroke and			
thrombo-embolic events should be considered in			
patients with RCM and AF or atrial flutter (unless			
contraindicated).	lla	C	19
Oral anticoagulation to reduce the risk of stroke and

or of 2 in women	lla	В	Ja
Control of symptoms and heart failure			
Atrial fibrillation catheter ablation is recommended			
for rhythm control after one failed or intolerant class			
I or III AAD to improve symptoms of AF recurrences			
in patients with paroxysmal or persistent AF and		_	
cardiomyopathy.	I	В	Ja
Atrial fibrillation catheter ablation is recommended			
to reverse LV dysfunction in AF patients with			
cardiomyopathy when tachycardia-induced			
component is highly probable, independent of their			
symptom status.	I	В	Ja, overvej dog DanAblate Studiet
Maintenance of sinus rhythm rather than rate control			
should be considered at an early stage for patients			
with a cardiomyopathy and AF without major risk			
factors for recurrence, regardless of symptoms.	lla	С	Ja, overvej dog DanAblate Studiet
Atrial fibrillation catheter ablation should be			
considered as first-line rhythm control therapy to			
improve symptoms in selected patients with			
cardiomyopathy and paroxysmal or persistent AF			
without major risk factors for recurrences as an			
alternative to class I or III AADs, considering patient			
choice, benefit, and risk.	lla	С	Ja

lla

В

Atrial fibrillation catheter ablation should be considered in selected patients with cardiomyopathy,			
AF, and heart failure and/or reduced LVEF to prevent			
AF recurrences and improve QoL, LVEF, and survival			
and reduce heart failure hospitalization.	lla	В	Ja
Comorbidities and associated risk factor management			
Modification of unhealthy lifestyle and targeted			
therapy of intercurrent conditions is recommended			
to reduce AF burden and symptom severity in			
patients with cardiomyopathy	I	В	Ja

mendation Table 12 — Recommendations for

Recommendation Table 12 — Recommendations for			
implantable cardioverter defibrillator in patients with			
cardiomyopathy side 43	Class	Level	
General recommendations			
Implantation of a cardioverter defibrillator is only			
recommended in patients who have an expectation			
of good quality survival >1 year.	I	С	Ja
It is recommended that ICD implantation be guided			
by shared decision-making that:			
• is evidence-based;			
 considers a person's individual preferences, beliefs, 			
circumstances, and values; and			
 ensures that the person understands the benefits, 			
harms, and possible consequences of different			
treatment options.	I.	С	Ja
It is recommended that prior to ICD implantation,			
patients are counselled on the risk of inappropriate			
shocks, implant complications, and the social,			
occupational, and driving implications of the device.	1	С	Ja
It is not recommended to implant an ICD in patients			
with incessant ventricular arrhythmias until the			
ventricular arrhythmia is controlled.	111	С	Ja
Secondary prevention			
Implantation of an ICD is recommended:			
in patients with HCM, DCM, and ARVC who have			
survived a cardiac arrest due to VT or VF, or who			
have spontaneous sustained ventricular arrhythmia			
causing syncope or haemodynamic compromise in			
the absence of reversible causes.	1	В	Ja
in patients with NDLVC and RCM who have			
survived a cardiac arrest due to VT or VF, or who			
have spontaneous sustained ventricular arrhythmia			
causing syncope or haemodynamic compromise in			
the absence of reversible causes	I	С	Ja
ICD implantation should be considered in patients with			
cardiomyopathy presenting with haemodynamically			
tolerated VT, in the absence of reversible causes	lla	С	Ja
Primary prevention

Reco	ommendation rable 13 — Recommendations for			
rout	tine follow-up of patients with cardiomyopathy side 44	Class	Level	
It is	recommended that all clinically stable patients			
with	n cardiomyopathy undergo routine follow-up			
usin	g a multiparametric approach that includes ECG			
and	echocardiography every 1 to 2 years.	I.	С	Tilpasses patient/sygdom
Clini	ical evaluation with ECG and multimodality			
ima	ging is recommended in patients with			
card	liomyopathy whenever there is a substantial or			
une	xpected change in symptoms.	1	С	Ja

Recommendation Table 14 — Recommendations for				
family screening and follow-up evaluation of relatives side 44	Class L	evel		
Following cascade genetic testing, clinical evaluation				
using a multiparametric approach that includes ECG				
and cardiac imaging and long-term follow-up is				
recommended in first-degree relatives who have the				
same disease-causing variant as the				
proband	I B		Der anbefales standard klinisk undersøge	else samtidigt med genetisk udredning
Following cascade genetic testing, it is recommended				
that first-degree relatives without a phenotype who				
do not have the same disease-causing variant as the				
proband are discharged from further follow-up but				
advised to seek re-assessment if they develop				
symptoms or when new clinically relevant data				
emerge in the family.	I C		Ja	

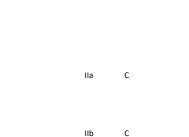

It is recommended that when no P/LP variant is identified in the proband or genetic testing is not performed, an initial clinical evaluation using a			
multiparametric approach that includes ECG and			
cardiac imaging is performed in first-degree relatives.	I	С	Uden påvist familiær sygdom og blank genetik da individuel stillingtagen til familieus
When no P/LP variant is identified in the proband or			
genetic testing is not performed, regular, long-term			
clinical evaluation using a multiparametric approach			
that includes ECG and cardiac imaging should be			
considered in first-degree relatives.	lla	С	Individuel stillingtagen, mange af disse slægtninge vil kunne afsluttes
During cascade screening, where a first-degree			
relative has died, clinical evaluation of close relatives			
of the deceased individual (i.e. second-degree			
relatives of the index patient) should be considered.	lla	С	Ja

Recommendation Table 15 — Recommendations for			
psychological support in patients and family members			
with cardiomyopathies	Class	Level	
It is recommended that psychological support by an			
appropriately trained health professional be offered			
to all individuals who have experienced the			
premature sudden cardiac death of a family member			
with cardiomyopathy.	I	В	Ja, afhængig af lokale tilbud
It is recommended that psychological support by an			
appropriately trained health professional be offered			
to all individuals with an inherited cardiomyopathy			
who receive an implantable cardioverter			
defibrillator	I	В	Ja, afhængig af lokale tilbud
Psychological support by an appropriately trained			
health professional should be considered in all			
patients and families with an inherited			
cardiomyopathy and in particular for those issues			
described in the text	lla	С	Ja, afhængig af lokale tilbud

Recommendation Table 16 — Recommendation for				
evaluation of left ventricular outflow tract obstruction	Class	Level		
In all patients with HCM, at initial evaluation,				
transthoracic 2D and Doppler echocardiography are				
recommended, at rest and during Valsalva				
manoeuvre in the sitting and semi-supine positions—				
and then on standing if no gradient is provoked—to				
detect LVOTO.	I.	В	Ja, der udføres dog liggende undersøgelse	e som standard
In symptomatic patients with HCM and a resting or				
provokedc peak instantaneous LV outflow tract				
gradient <50 mmHg, 2D and Doppler				
echocardiography during exercise in the standing,				
sitting (when possible), or semi-supine position are				
recommended to detect provocable LVOTO and				
exercise-induced mitral regurgitation	I	В	Her anbefales arbejdsekkokardiografi	

Transoesophageal echocardiography should be considered in patients with HCM and LVOTO if the mechanism of obstruction is unclear or when assessing the mitral valve apparatus before a septal reduction procedure, or when severe mitral regurgitation caused by intrinsic valve abnormalities is suspected

In symptomatic patients with HCM and inconclusive non-invasive cardiac imaging, left and right heart catheterization may be considered to assess the severity of LVOTO and to measure LV filling pressures.

Recommendation Table 17 — Additional recommendation			
for cardiovascular magnetic resonance evaluation			
in hypertrophic cardiomyopathy side 48	Class Level		
Contrast-enhanced CMR may be considered before			
ASA or myectomy to assess the extent and			
distribution of hypertrophy and myocardial			
fibrosis	llb C	Ja

titrated to maximum tolerated dose with				
echocardiographic surveillance of LVEF, should be				
considered as monotherapy in symptomatic adult				
patients with resting or provokedc LVOTO (exercise				
or Valsalva manoeuvre) who are intolerant or have				
contraindications to beta-blockers, verapamil/				
diltiazem, or disopyramide	lla	В	Novementen har delumenteret effekt i	nen plads i behandlingshierakiet uafklaret. Se generel tekst.
Oral or i.v. beta-blockers and vasoconstrictors	lia	В	Mavacamten har dokumenteret errekt, h	nen plads i benandlingsnierakiet uarkiaret. Se generei tekst.
should be considered in patients with severe				
provocablec LVOTO presenting with hypotension				
and acute pulmonary oedema who do not respond		<u> </u>	1.	
to fluid administration	lla	L	Ja	
Disopyramide, titrated to maximum tolerated dose,				
may be considered as monotherapy in patients who				
are intolerant to or have contraindications to				
beta-blockers and verapamil/diltiazem to improve				
symptoms in patients with resting or provokedc				
LVOTO.	Ilb	C		Disopyramid ikke tilgængeligt i DK
Beta-blockers or verapamil may be considered in				
selected cases in asymptomatic patients with resting				
or provokedc LVOTO to reduce LV pressures	Ilb	C	Ja	
The cautious use of low-dose diuretics may be				
considered in symptomatic LVOTO to improve				
exertional dyspnoea.	llb	C	Ja	

Recommendation Table 20 — Recommendations for				
septal reduction therapy	Class	Level		
It is recommended that SRT be performed by				
experienced operators working as part of a				
multidisciplinary team expert in the management of				
HCM	L. L.	С	Ja	
SRT to improve symptoms is recommended in				
patients with a resting or maximum provoked LVOT				
gradient of ≥50 mmHg who are in NYHA/Ross				
functional class III–IV, despite maximum tolerated				
medical therapy	L. L.	В	Ja	
Septal myectomy, rather than ASA, is recommended				
in children with an indication for SRT, as well as in				
adult patients with an indication for SRT and other				
lesions requiring surgical intervention (e.g. mitral				
valve abnormalities).	I. I.	С	Ja	
SRT should be considered in patients with recurrent				
exertional syncope caused by a resting or maximum				
provoked LVOTO gradient ≥50 mmHg despite				
optimal medical therapy	lla	С	Ja	

Mitral valve repair or replacement should be			
considered in symptomatic patients with a resting or			
maximum provoked LVOTO gradient ≥50 mmHg			
and moderate-to-severe mitral regurgitation that			
cannot be corrected by SRT alone	lla	С	Ja
Mitral valve repair should be considered in patients			
with a resting or maximum provoked LVOTO			
gradient ≥50 mmHg when there is			
moderate-to-severe mitral regurgitation following			
isolated myectomy.	lla	С	Ja
SRT may be considered in expert centres with			
demonstrable low procedural complication rates in			
patients with mild symptoms (NYHA class II)			
refractory to medical therapy who have a resting or			
maximum provoked (exercise or Valsalva) gradient			
of ≥50 mmHg and:			
 moderate-to-severe SAM-related mitral 			
regurgitation; or			
• AF; or			
 moderate-to-severe left atrial dilatation 	IIb	С	Ja
Mitral valve replacement may be considered in			
patients with a resting or maximum provoked			
LVOTO gradient ≥50 mmHg when there is			
moderate-to-severe mitral regurgitation following			
isolated myectomy	IIb	С	Ja
Surgical AF ablation and/or left atrial appendage			
occlusion procedures during septal myectomy may			
be considered in patients with HCM and			
symptomatic AF	IIb	С	Ja

Recommendation Table 21 — Recommendations for
indications for cardiac pacing in patients with

bbstruction side 55 Sequential AV pacing, with optimal AV interval to reduce the LV outflow tract gradient or to facilitate medical treatment with beta-blockers and/or verapamil, may be considered in selected patients with resting or provocable LVOTO ≥50 mmHg, sinus rhythm, and drug-refractory symptoms, who have contraindications for ASA or septal myectomy or are at high risk of developing heart block following ASA or septal myectomy.

In patients with resting or provocable LVOTO ≥50 mmHg, sinus rhythm, and drug-refractory symptoms, in whom there is an indication for an ICD, a dual-chamber ICD (instead of a single-lead device) may be considered, to reduce the LV outflow tract gradient or to facilitate medical treatment with beta-blockers and/or verapamil Class Level IIb C

Ja, omend pace-indikation LVOTO ikke bruges selvstændigt i DK mere.

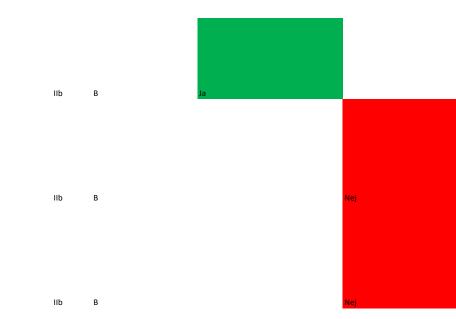

Recommendation Table 22 — Recommendations for chest pain on exertion in patients without left ventricular outflow tract obstruction side 55 Class Level

Beta-blockers and calcium antagonists (verapamil or diltiazem) should be considered to improve symptoms				
in patients with angina-like chest pain even in the absence of LVOTO or obstructive CAD Oral nitrates may be considered to improve	lla	С	Ja	
symptoms in patients with angina-like chest pain, even in the absence of obstructive CAD, if there is no				
LVOTO. Ranolazine may be considered to improve symptoms	IIb	С	Ja	
in patients with angina-like chest pain even in the absence of LVOTO or obstructive CAD	llb	с		Ikke tilgængeligt i DK

Recommendation Table 23 — Additional recommendations			
for prevention of sudden cardiac death in			
patients with hypertrophic cardiomyopathy	Class	Level	
SECONDARY PREVENTION			
Implantation of an ICD is recommended in patients			
who have survived a cardiac arrest due to VT or VF,			
or who have spontaneous sustained VT with			
haemodynamic compromise	I.	В	Ja
PRIMARY PREVENTION			
The HCM Risk-SCD calculator is recommended as a			
method of estimating risk of sudden death at 5 years			
in patients aged ≥16 years for primary			
prevention	I	В	Ja
Validated paediatric-specific risk prediction models			
(e.g. HCM Risk-Kids) are recommended as a method			
of estimating risk of sudden death at 5 years in			
patients aged <16 years for primary prevention	I. I.	В	Ja
It is recommended that the 5-year risk of SCD be			
assessed at first evaluation and re-evaluated at 1–2			
year intervals or whenever there is a change in clinical			
status	I.	В	Ja, hvis sandsynlig klinisk konsekvens afhængig af alder, komorbiditet, mm
Implantation of an ICD should be considered in			
patients with an estimated 5-year risk of sudden			
death of ≥6%, following detailed clinical assessment			
that considers:			
(i) the lifelong risk of complications;			
(ii) competing mortality risk from the disease and			
comorbidities;			
AND			
(iii) the impact of an ICD on lifestyle,			
socio-economic status, and psychological			
health	lla	В	Ja
In patients with LV apical aneurysms, decisions about			
primary prevention ICD based on an assessment of			
risk using the HCM Risk-SCD or a validated			
paediatric risk-prediction (e.g. HCM Risk-Kids) tool			
and not solely on the presence of the aneurysm			
should be considered	lla	В	Ja

Implantation of an ICD may be considered in individual patients with an estimated 5-year risk of SCD of between ≥4% and <6%, following detailed clinical assessment that takes into account the lifelong risk of complications and the impact of an ICD on lifestyle, socio-economic status, and psychological health

For patients who are in the low-risk category (<4% estimated 5-year risk of SCD), the presence of extensive LGE (≥15%) on CMR may be considered in shared decision-making with patients about prophylactic ICD implantation, acknowledging the lack of robust data on the impact of scar quantification on the personalized risk estimates generated by HCM Risk-SCD or a validated paediatric model (e.g. HCM Risk-Kids) For patients who are in the low-risk category (<4% estimated 5-year risk of SCD), the presence of LVEF <50% may be considered in shared decision-making with patients about prophylactic ICD implantation, acknowledging the lack of robust data on the impact of systolic dysfunction on the personalized risk estimates generated by HCM Risk-SCD or a validated paediatric model (e.g. HCM Risk-Kids).

Recommendation Table 24 — Recommendations for			
an implantable cardioverter defibrillator in patients			
with dilated cardiomyopathy side 64	Class	Level	
SECONDARY PREVENTION			
An ICD is recommended to reduce the risk of			
sudden death and all-cause mortality in patients with			
DCM who have survived a cardiac arrest or have			
recovered from a ventricular arrhythmia causing			
haemodynamic instability	I	В	Ja
PRIMARY PREVENTION			
An ICD should be considered to reduce the risk of			
sudden death and all-cause mortality in patients with			
DCM, symptomatic heart failure, and LVEF ≤35%			
despite >3 months of OMT.	lla	A	Ja
The patient's genotype should be considered in the			
estimation of SCD risk in DCM	lla	В	Ja
An ICD should be considered in patients with DCM			
with a genotype associated with high SCD risk and			
LVEF >35% in the presence of additional risk factors			
(see Table 21).	lla	С	Ja
An ICD may be considered in selected patients with			
DCM with a genotype associated with high SCD risk			
and LVEF >35% without additional risk factors (see			
Table 21).	IIb	С	Ja
An ICD may be considered in patients with DCM			
without a genotype associated with high SCD risk			
and LVEF >35% in the presence of additional risk			
factors	IIb	С	Ja

Recommendation Table 25 — Recommendation for			
resting and ambulatory electrocardiogram monitoring			
in patients with non-dilated left ventricular			
cardiomyopathy side 65	Class	Level	
Ambulatory ECG monitoring is recommended in			
patients with NDLVC annually or when there is a			
change in clinical status, to aid in management and			
risk stratification.	I.	С	Individuel vurdering. Der foreligger utilstrækkelige data for NDLVC fænotypen
TISK Stratification.	1	L	individuel vardening. Der forengger utilstrækkenge data for ivbEve fændtypen

Descent and the Table 27 - Descent and the fea			
Recommendation Table 27 — Recommendation for			
resting and ambulatory electrocardiogram monitoring			
in patients with arrhythmogenic right ventricular			
cardiomyopathy side 67	Class	Level	
Annual ambulatory ECG monitoring is			
recommended in patients with ARVC to aid in			
diagnosis, management, and risk stratification.	I.	С	Ja
Recommendation Table 28 — Recommendations for			
the antiarrhythmic management of patients with			
arrhythmogenic right ventricular cardiomyopathy side 68	Class	Level	
Beta-blocker therapy is recommended in ARVC			
patients with VE, NSVT, and VT.	I.	С	Ja, inklusiv sotalol
Amiodarone should be considered when regular			
beta-blocker therapy fails to control			
arrhythmia-related symptoms in patients with			
ARVC.	lla	С	Overvej sotalol før amiodaron

Flecainide in addition to beta-blockers should be

considered when single agent treatment has failed to

control arrhythmia-related symptoms in patients

with ARVC.

IIa

Catheter ablation with availability for epicardial

approach guided by 3D electroanatomical mapping

of VT should be considered in ARVC patients with

incessant VT or frequent appropriate ICD

interventions for VT despite pharmacological

therapy with beta-blockers

IIa

Recommendation Table 29 – Recommendations for

sudden cardiac death prevention in patients with

sudden cardiac death prevention in patients with			
arrhythmogenic right ventricular cardiomyopathy	Class	Level	
SECONDARY PREVENTION			
An ICD is recommended to reduce the risk of			
sudden death and all-cause mortality in patients with			
ARVC who have survived a cardiac arrest or have			
recovered from a ventricular arrhythmia causing			
haemodynamic instability	I.	A	Ja
An ICD should be considered in ARVC patients who			
have suffered a haemodynamically tolerated			
VT.	lla	В	Ja
PRIMARY PREVENTION			
High-risk featuresc should be considered to aid			
individualized decision-making for ICD implantation			
in patients with ARVC.	lla	В	Ja
The updated 2019 ARVC risk calculator should be			
considered to aid individualized decision-making for			
ICD implantation in patients with ARVC	lla	В	<mark>Flere forbehold, men kan indgå i helheds</mark> vurderingen

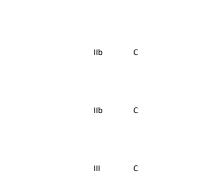

Recommendation Table 30 — Recommendations for			
the management of patients with restrictive			
cardiomyopathy side 72	Class	Level	
It is recommended that multimodality imaging be			
used to differentiate RCM from HCM or DCM with			
restrictive physiology	I	С	Ja
It is recommended that baseline cardiac and			
non-cardiac investigations are performed to assess			
involvement of the neuromuscular system or other			
syndromic disorders.	I	С	Ja
Cardiac catheterization is recommended in all			
children with RCM to measure pulmonary artery			
pressures and PVR at diagnosis and at 6–12 monthly			
intervals to assess change in PVR	I	В	Efter individuel vurdering
ICD implantation is recommended to reduce the risk			
of sudden death and all-cause mortality in patients			
with RCM who have survived a cardiac arrest or have			
recovered from a ventricular arrhythmia causing			
haemodynamic instability.	Į.	С	Ja

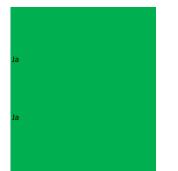

Endomyocardial biopsy should be considered in			
patients with RCM to exclude specific diagnoses			
(including iron overload, storage disorders,			
mitochondrial cytopathies, amyloidosis, and			
granulomatous myocardial diseases) and to diagnose			
restrictive myofibrillar disease caused by desmin			
variants.	lla	С	Ja
ICD implantation may be considered in children with			
RCM who have evidence of myocardial ischaemia and			
syncope.	IIb	С	Efter individuel vurdering

Recommendation Table 31 — Exercise recommendations			
for patients with cardiomyopathy side 80	Class	Level	
ALL CARDIOMYOPATHIES	Ciuss	Level	
Regular low- to moderate-intensity exercise is			
recommended in all able individuals with			
cardiomyopathy	I	С	Ja, dog særlige forhold ved ARVC
An individualized risk assessment for exercise		C	
prescription is recommended in all patients with			
cardiomyopathy.	I	С	la
нсм	•	C	50
High-intensity exercise and competitive sport should			
be considered in genotype-positive/			
phenotype-negative individuals who seek to do			
so	lla	С	Ja
High-intensity exercise and competitive sport may be		-	
considered in asymptomatic low-riskc individuals			
with morphologically mild hypertrophic			
cardiomyopathy in the absence of resting or			
inducible left ventricular outflow obstruction and			
exercise-induced complex ventricular			
arrhythmias	IIb	В	Ja
High-intensity exercise, including competitive sport,			
is not recommended in high-risk individuals and in			
individuals with left ventricular outflow tract			
obstruction and exercise-induced complex			
ventricular arrhythmias.		В	Ja
ARVC			
Avoidance of high-intensity exercise, including			
competitive sport, may be considered in			
genotype-positive/phenotype-negative individuals in			
families with ARVC	IIb	С	Ja
Moderate- and/or high-intensity exercise, including			
competitive sport, is not recommended in individuals			
with ARVC	Ш	В	Ja
DCM and NDLVC			
Moderate- and high-intensity exercise should be			
considered in individuals who are gene positive and			
phenotype negative (with the exception of			
pathogenic variants in LMNA and TMEM43) who seek			
to do so	lla	С	Ja, dog også medtaget asymptomatisk

High-intensity exercise and competitive sport may be considered in a select group of asymptomatic and optimally treated individuals with a left ventricular ejection fraction 250% in the absence of exercise-induced complex arrhythmias. Moderate-intensity exercise may be considered in asymptomatic and optimally treated individuals with a left ventricular ejection fraction of 40–49% in the absence of exercise-induced complex arrhythmias.

High-intensity exercise, including competitive sport, is not recommended in symptomatic individuals, those with a left ventricular ejection fraction ≤40%, exercise-induced arrhythmias or pathogenic variants in LMNA or TMEM43

Ja, dog ikke indbefattet fænotypiske raske LMNA bærere

Recommendation Table 32 — Recommendations for			
reproductive issues in patients with cardiomyopathy side 83	Class	Level	
Pre-pregnancy risk assessment and counselling are			
recommended in all women using the mWHO			
classification of maternal risk.	I	С	Ja
Counselling on safe and effective contraception is			
recommended in all women of fertile age and their			
partners.	I.	С	Ja, ved relevans
Counselling on the risk of disease inheritance is			
recommended for all men and women before			
conception.	I	С	Ja
Vaginal delivery is recommended in most women			
with cardiomyopathies, unless there are obstetric			
indications for caesarean section, severe heart failure			
(EF <30% or NYHA class III–IV), or severe outflow			
tract obstructions, or in women presenting in labour			
on oral anticoagulants.	I	С	Ja
It is recommended that medication be carefully			
reviewed for safety in advance of pregnancy and			
adjusted according to tolerability in pregnancy.	I	С	Ja
Therapeutic anticoagulation with LMWH or VKAs			
according to the stage of pregnancy is recommended			
for patients with AF.	I	С	Ja
Continuation of beta-blockers should be considered			
during pregnancy in women with cardiomyopathies,			
with close follow-up of foetal growth and of the			
condition of the neonate, and if benefits outweigh			
risks.	lla	С	Ja
Genetic counselling and testing should be considered			
in patients with peripartum cardiomyopathy.	lla	С	Ja

Ree	commendation Table 33 — Recommendations for			
noi	n-cardiac surgery in patients with cardiomyopathy Side 83	Class	Level	
Per	ri-operative ECG monitoring is recommended for			
all	patients with cardiomyopathy undergoing surgery.	I.	С	Efter individuel vurdering

In patients with cardiomyopathy and suspected or				
known HF scheduled for intermediate or high-risk				
NCS, it is recommended to re-evaluate LV function				
with echocardiography (assessing LVOTO in HCM				
patients) and measurement of NT-proBNP/BNP				
levels, unless this has recently been				
performed	1	В	Efter individuel vurdering	
It is recommended that cardiomyopathy patients				
with high-risk genotypes or associated factors for				
arrhythmic or heart failure complications or severe				
LVOTO be referred for additional specialized				
investigations to a cardiomyopathy unit before				
undergoing elective NCS.	1	С		Anbefales ikke som udgangspunkt
In patients aged <65 years with a first-degree relative				
with a cardiomyopathy, it is recommended to perform				
an ECG and TTE before NCS, regardless of symptoms.	1	С		Anbefales ikke som udgangspunkt

	Recommendation Table 34 — Recommendation for				
	nanagement of cardiovascular risk factors in patients				
	vith cardiomyopathy side 86	Class	Level		
1	dentification and management of risk factors and				
	concomitant diseases is recommended as an integral				
1	part of the management of cardiomyopathy patients.	I	С	Ja
